

Entry, configuration and run provenance

A single entry layer validates local and HPC configuration before any literature, deployment or evaluation Agent is allowed to execute.

1	4	1	1
unified menu	control files	environment file	run manifest

Agent contracts and responsibilities

versioned Markdown or control files

ROLE	DEFINITION FILE	RESPONSIBILITY
Workflow control	No role-specific Agent	Human workflow selection and authorization
Global safeguards	workflow_guards.py	Preflight checks before deployment or evaluation

Execution sequence

ordered file handoffs

01	02	03	04	05
Select	→ Dispatch	→ Configure	→ Gate	→ Record
run_menu.bat	amp_benchmark_menu.py	config.py + .env	workflow_guards.py	run_manifest.py

Persisted evidence and stage handoff

project-state artifacts

ARTIFACT	ROLE	AUDIT / HANDOFF MEANING
run_menu.bat	entry	starts the interactive workflow
amp_benchmark_menu.py	orchestrator	routes literature, onboarding and benchmark tasks
config.py + .env	configuration	API, HPC, SLURM, model and metric settings
workflow_guards.py	gate	blocks incomplete or unsafe runs
run_manifest.py	provenance	records inputs, versions, events and artifacts

Control invariant

Credentials remain local; every formal run receives a manifest before downstream scientific outputs are accepted.
