

Repository registration and HPC deployment

README-derived model contracts are converted into registry records, uploaded to HPC, installed in isolated environments and admitted only after smoke testing.

8	8	42	1
registry entries	marked ready	repair artifacts	smoke-test gate

Agent contracts and responsibilities

versioned Markdown or control files

ROLE	DEFINITION FILE	RESPONSIBILITY
Repository inspector	model_onboarding/repository_inspector_system.md	Translate README, requirements and commands into a registry proposal
Inspector task	model_onboarding/repository_inspector_task.md	Constrain the repository-specific extraction task
Self-heal system	model_execution/self_heal_system.md	Diagnose logs and propose bounded repairs
Self-heal task	model_execution/self_heal_task.md	Retry only approved environment or invocation changes

Execution sequence

ordered file handoffs

Persisted evidence and stage handoff

project-state artifacts

ARTIFACT	ROLE	AUDIT / HANDOFF MEANING
new_model_onboarding.py	local engine	repository inspection and registry generation
hpc_model_ops.py	HPC engine	upload, environment creation, repair and smoke test
data/local_registry.json	durable model state	repository, environment, command and readiness
data/hpc_self_heal/	repair evidence	failure logs, proposed repair and retry record
skip_env_setup=true	admission state	written only after the deployment gate succeeds

Admission rule

A model name in the registry is insufficient; environment readiness, inference command and smoke-test evidence must all be available before formal benchmarking.
